

# Lessons Learned for Improving Accessibility in Assessments for Students with Disabilities

**U.S. Department of Education**

In partnership with

**Council of Chief State School Officers**

**May 22, 2012 • Washington, DC**

*Please silence all cell phones and pagers.*

*Thank you!*

# Introduction and Meeting Goals

*Alexa Posny, Assistant Secretary*

*Office of Special Education and Rehabilitative Services*

*Ann Whalen, Director of Policy and Program  
Implementation*

*Implementation and Support Unit*

# Introduction

- Today's meeting is held in partnership:
  - Office of Special Education and Rehabilitative Services (OSERS)
  - Implementation and Support Unit (ISU)
  - Council of Chief State School Officers' Assessing Special Education Services (ASES) State Collaborative on Assessments and Student Standards (SCASS)
- Funded in part by The William and Flora Hewlett Foundation

# Goals for the Meeting

- Share lessons learned from research and assessment development under previous grants
- Offer assistance to consortia developing next-generation assessment systems
- Format:
  - Five former grantees presenting research and lessons learned on improving accessibility of general assessments for students with disabilities
  - Table discussion with representatives from the consortia: PARCC, Smarter Balanced, the National Center and State Collaborative, and Dynamic Learning Maps

# Consortia

- Awarded in September 2010
- Four-year grants to develop next-generation assessment systems in English language arts and mathematics

## **General Supervision Enhancement Grants**

- Assessments for students with the most significant cognitive disabilities
- Two consortia, comprising 31 states and DC
  - National Center and State Collaborative (NCSC)
  - Dynamic Learning Maps

## **Race to the Top Assessment**

- Two consortia representing 45 states and DC
  - Partnership for Assessment of Readiness of College and Careers (PARCC)
  - Smarter Balanced Assessment Consortium (Smarter Balanced)

# IDEA

# Who Are Children with Disabilities?

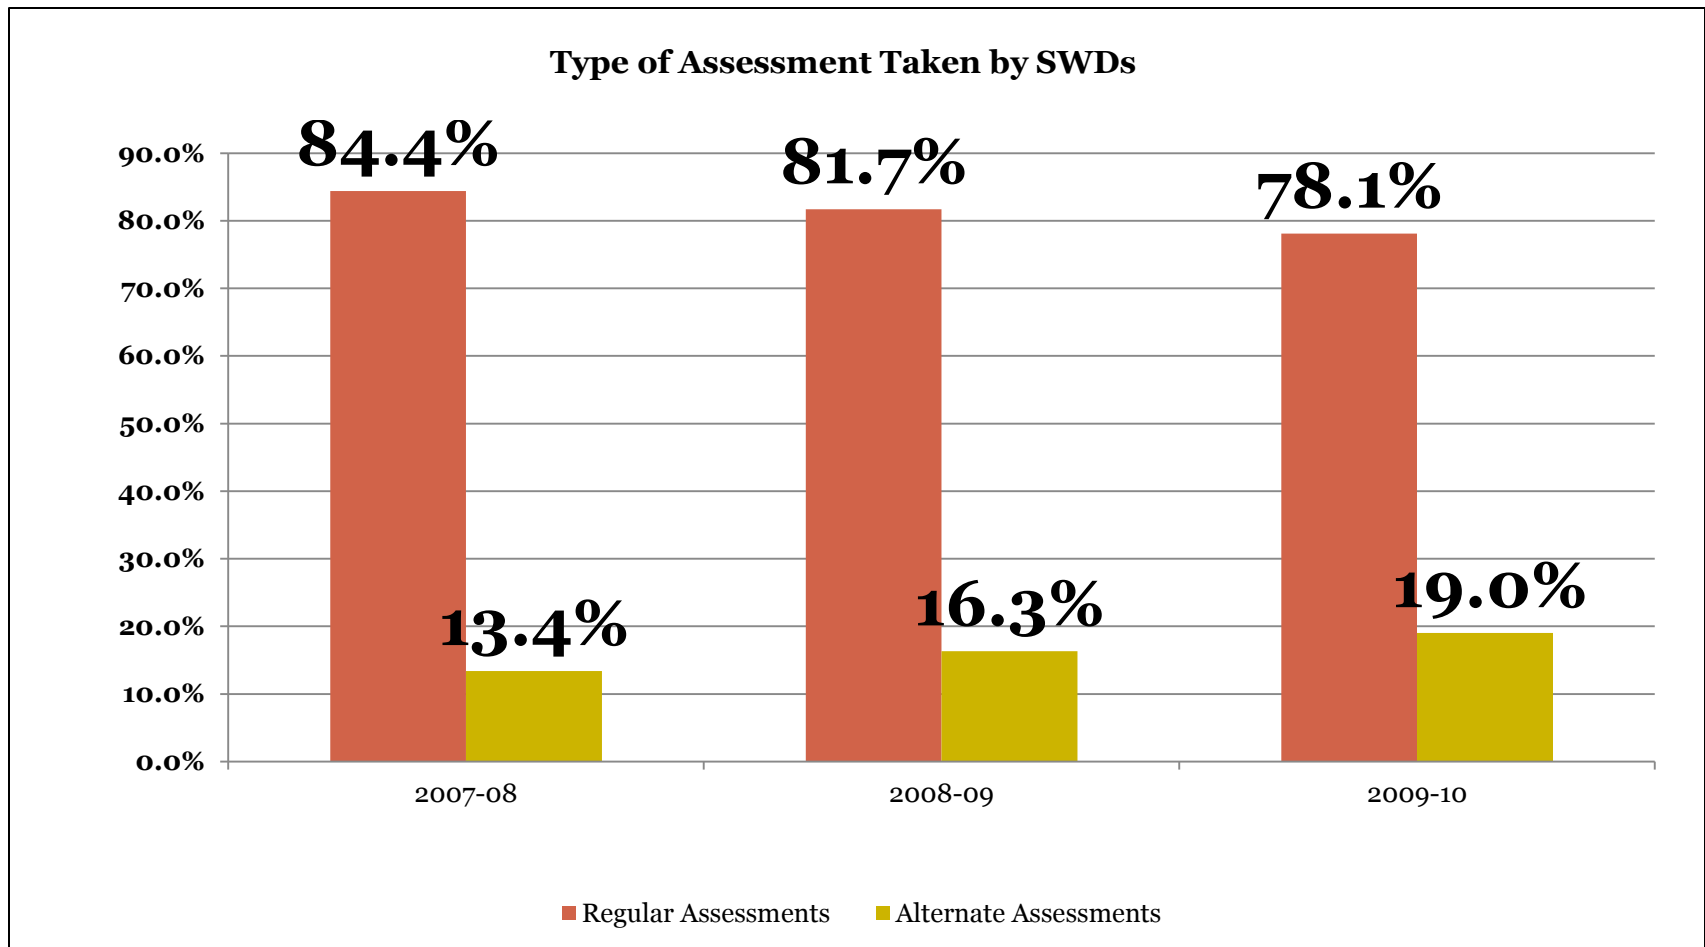

IDEA provides services for 6.9 million individuals with disabilities from birth through age 21

- 3% of population birth to age 2
- 14% of public school enrollees

## 13 Disability Categories

- 41% Specific Learning Disabilities
- 19% Speech or Language Impairments
- 17% All other categories
- 8% Intellectual Disabilities
- 7% Emotional Disturbance
- 6% Autism
- 2% Multiple Disabilities

# How are SWDs participating in Statewide Assessments?

# Accountability:

Holding All Students to High Standards

SWDs can meet college- and career-ready standards:

- SWDs can excel within the general curriculum.
- SWDs can be prepared for success in post-secondary including college and/or careers.

SWDs must be ensured:

- Access to the general curriculum
- Ability to meet their unique needs
- IEPs with goals aligned to grade-level academic standards
- Teachers and support personnel able to deliver high-quality, evidence-based, individualized instructional and support services

# Student Outcome Increases (1998-2009)

|                               | All Students | Students with Disabilities |
|-------------------------------|--------------|----------------------------|
| 4 <sup>th</sup> grade reading | 8%           | 8%                         |
| 8 <sup>th</sup> grade math    | 10%          | 6%                         |
| Graduation rates              | 3.4%         | 10%                        |
| Post secondary enrollment     | 8%           | 38%                        |
| 4 year college enrollment     | 14%          | 13%                        |

# RTTA Public Meetings

- This is the fourth RTTA public meeting.
  - April 15– Technology infrastructure
  - June 10– Automated scoring
  - August 10– Accessibility for students with disabilities and English learners
- The purpose of the meetings is to:
  - To support collaboration and provide technical assistance to PARCC and Smarter Balanced as they develop new assessment systems
  - Expand the knowledge and expertise of the Department and the public around key assessment issues
  - Facilitate discussion of key components of the systems with experts

# About RTTA

- Support states in delivering a system of more effective and instructionally useful assessments that:
  - Provide accurate information about what students know and can do by:
    - Eliciting complex student demonstrations or applications of knowledge and skills, as appropriate
    - Accurately measuring student achievement across the full performance continuum
    - Accurately measuring student growth over a full academic year or course;
    - Helping educators determine whether individual students are ready for college and careers by the time of high school graduation and, in previous grade levels, whether they are on-track for readiness
  - Reflect good instructional practice and support a culture of continuous improvement
  - Effectively assess all students, including students with disabilities and English learners

# Looking Forward

- Assessment systems must include one or more summative assessment components that are fully implemented by every state in each consortium by SY 2014-15, and are administered at least once during the academic year in, at a minimum:
  - English language arts and mathematics
  - Grades 3-8 and high school
- Results used to inform:
  - Teaching, learning, and program improvement
  - Determinations of school effectiveness
  - Determinations of principal and teacher effectiveness for the purposes of evaluation and support
  - Determinations of individual student college- and career-readiness

# Students with Disabilities in RTTA

- The absolute priority requires that consortia create assessments for all students, including students with disabilities and English learners
- The consortia are required to develop tests accessible for these populations and to create and standardize accommodations policies
- PARCC and Smarter Balanced have established panels of external experts knowledgeable about the needs of students with disabilities to inform assessment development

# Meeting Agenda

|             |   |
|-------------|---|
| 8:30-9:00   | Welcome/setting the stage   |
| 9:00-9:30   | Inclusive assessment: Considerations                                      |
| 9:30-10:00  | Universal Design for Learning   |
| 10:00-10:15 | Break   |
| 10:15-10:45 | Cognitive labs and<br>Opportunity-to-Learn studies                        |
| 10:45-11:15 | Innovative Items  |
| 11:15-11:45 | Considerations in Assessing Low-<br>Performing Students with Disabilities |
| 11:45-12:00 | Concluding Comments & Wrap-up   |
| 12:00       | Adjourn   |

# Invited Experts

- Lou Danielson, American Institutes for Research
- Stephen Elliott, Arizona State University
- Steve Ferrara, Pearson
- Sheryl Lazarus, National Center for Educational Outcomes at the University of Minnesota
- Shelley Loving-Ryder, Virginia Department of Education

# Reminders

- Please place all cell phones and other devices on vibrate
- Resources:
  - Race to the Top Assessment: [www2.ed.gov/programs/racetothetop-assessment](http://www2.ed.gov/programs/racetothetop-assessment)
  - NCSC: [www.cehd.umn.edu/nceo/projects/NCSC/NCSC.html](http://www.cehd.umn.edu/nceo/projects/NCSC/NCSC.html)
  - Dynamic Learning Maps: [www.dynamiclearningmaps.org](http://www.dynamiclearningmaps.org)
- The purpose of this event is to promote a full discussion and hear a wide range of viewpoints on creating valid, reliable, and fair assessments for English learners and students with disabilities, as well as the challenges and opportunities afforded by the Race to the Top Assessment program. Through this meeting, the U.S. Department of Education is not seeking to promote and/or endorse any particular program, project, methodology or approach to this work.

**BREAK**

**Thank you!!**

*Alexa Posny*  
*U.S. Department of Education*

# Reminders

- Transcript and presentations from today's meeting will be available at:

[www2.ed.gov/programs/racetothetop-assessment](http://www2.ed.gov/programs/racetothetop-assessment)

- Written input may be submitted to [racetothetop.assessment@ed.gov](mailto:racetothetop.assessment@ed.gov)

# Future Public Meetings

- Future meetings may focus on:
  - Interoperability and technology standards
  - Selection of a uniform growth model consistent with test purpose, structure, and intended uses
  - Setting achievement standards and performance level descriptors
- Information about future meetings will be posted on [ed.gov](http://ed.gov) and shared with stakeholder groups and prior meeting participants

AMERICAN INSTITUTES FOR RESEARCH<sup>®</sup>

## *Ensuring General Assessment Access for Students with Disabilities: Overview and Considerations*

**Louis Danielson, Ph.D.**

Managing Director

May 2012

# Timeline

| 1975                | 1991        | 1996   | 1997                      | 2001                    |
|---------------------|-------------|--|---------------------------|-------------------------|
| P.L. 94-142 enacted | NCEO funded | NAEP establishes students with disabilities accommodations | IDEA mandates assessments | NCLB passed by Congress |

## Key

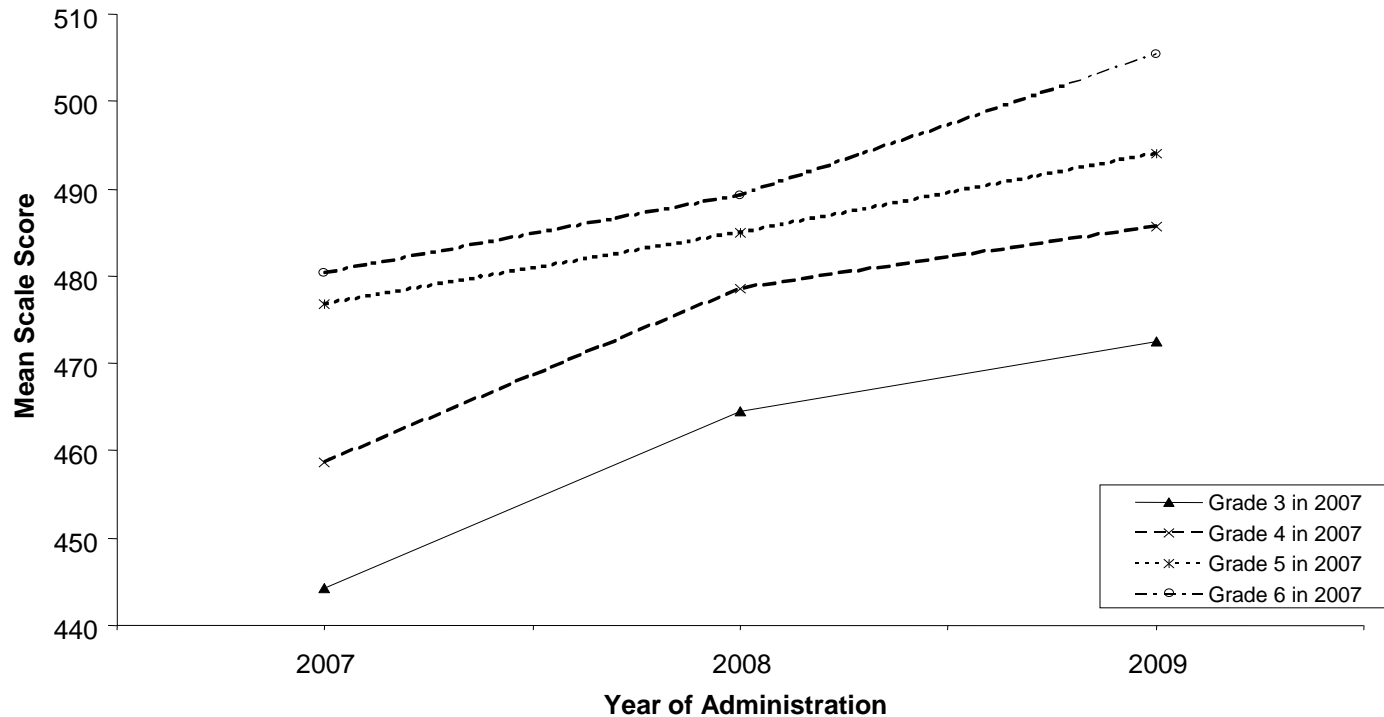

IDEA=Individuals with Disabilities Education Act  
NAEP=National Assessment of Educational Progress  
NCLB=No Child Left Behind Act  
NCEO=National Center on Educational Outcomes  
P. L. 94-142=Education of All Handicapped Children Act (now known as IDEA)

# Advances in Assessment of Students With Disabilities

- Alternative assessments
- Accommodations and universal design principles(UDL)
- Adaptive assessment
- Participation

# Growth on the Vertical Scale: New Mexico Mathematics

## New Mexico Alternative Assessment Mathematics Longitudinal Growth, by Grade

# Continuing Issues in Assessment for SWD

- Continuous progress monitoring vs. one time assessment
- Portfolios for alternative assessment
- Consistent accommodation policies across states
- Out-of-level testing
- Assessing higher order content

# Issues in Accountability Related to Students With Disabilities

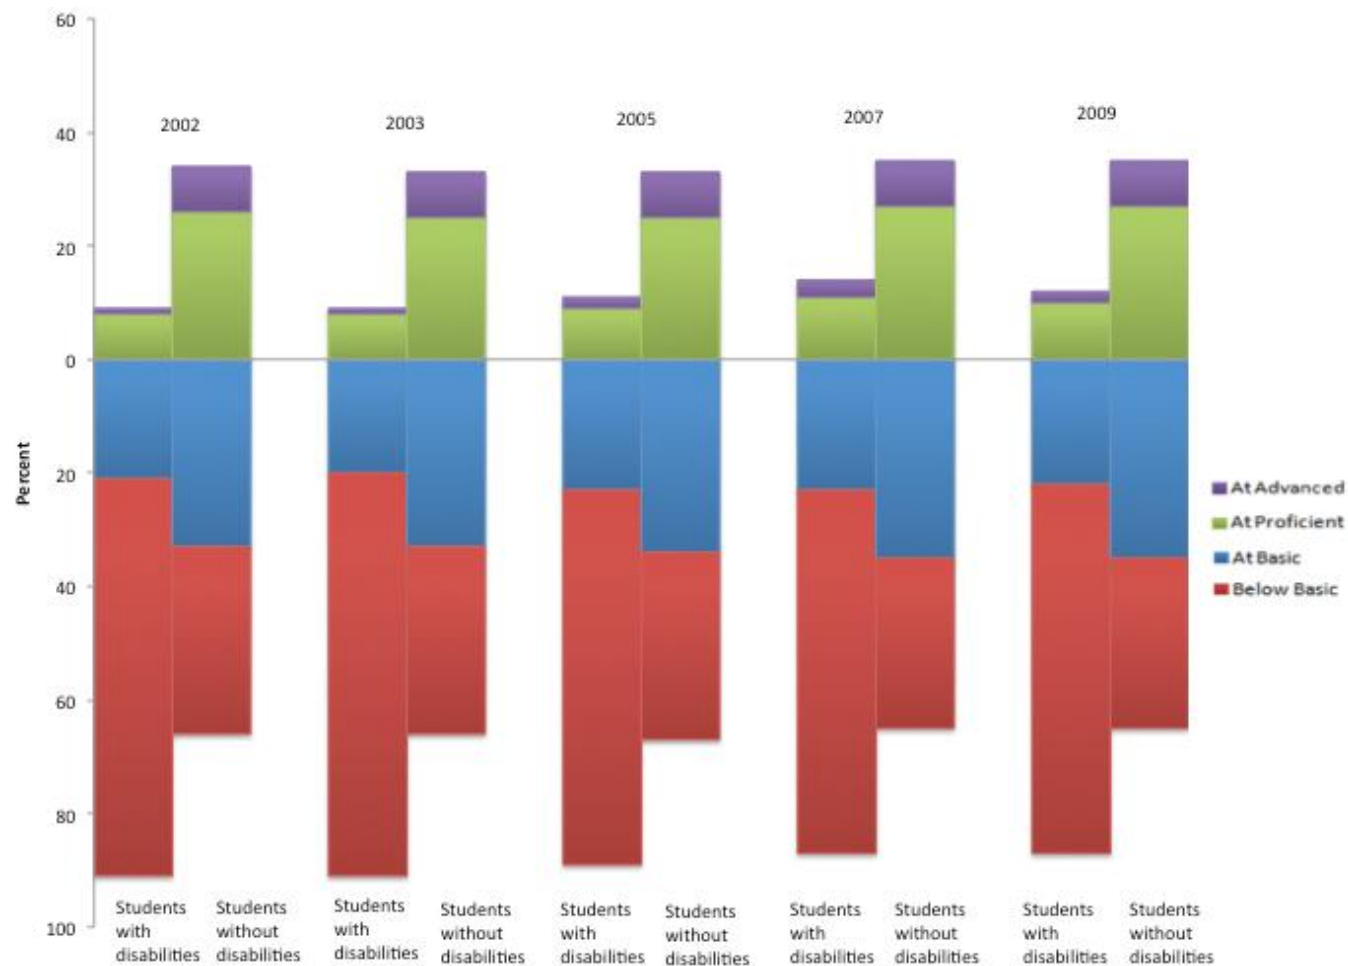

- “n” size
- Standards setting
- Fixed vs. progress standards
- Challenging expectations

## The Bottom Line

# Improve performance of students with disabilities

- Maintain challenging expectations for each SWD
- Create accountability system that incentivizes improvements in instruction

# Reading Achievement Levels at Grade 4 by Student Disability Status: Various Years, 2002–2009

## Looking Ahead

- Developing improved assessments
- Developing alternative forms of accountability
- Improving instruction

# Incorporating Universal Design Principles in Next Generation Assessment Item Design

**Sheryl Lazarus**

National Center on Educational Outcomes

Public Meeting:  
Lessons Learned for Improving Access to General Assessments by  
Low-Performing Students with Disabilities

Washington DC  
May 22, 2012

**National Center on Educational Outcomes (NCEO)**

# Universal Design

**The design of products and environments to be usable by all people, to the greatest extent possible, without the need for adaptation or specialized design.**

*Center for Universal Design (1997)*

# Think about universal design in architecture and tool design

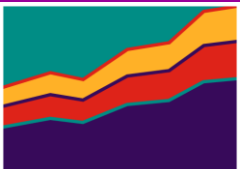

- **Curb cuts and ramps**
- **Elevators that talk to you**
- **Door handles rather than knobs**
- **Special pen shapes that are easier to hold**

# Universal Design for Learning (UDL)

- A set of principles for curriculum development that give all individuals equal opportunity to learn
- Provides a blueprint for creating instructional goals, methods, materials, and assessments that work for everyone.

*National Center on Universal Design for Learning*

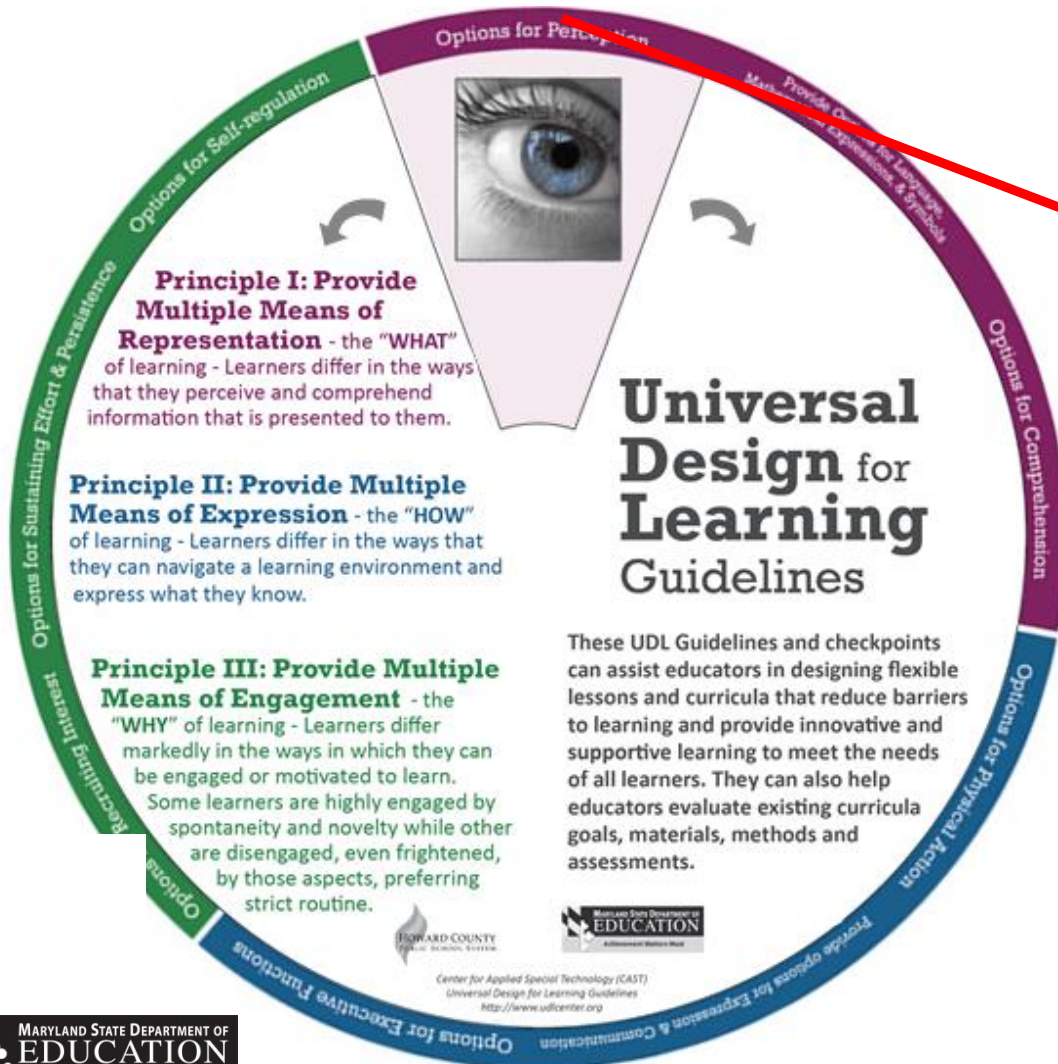

# Components of UDL

- Goals—learning expectations. They represent the knowledge, concepts, and skills all students should master, and are generally aligned to standards.
- Methods—instructional decisions, approaches, procedures that expert teachers use to accelerate or enhance learning.
- Materials—media used to present learning content
- Assessment—process of gathering information about a learner's performance using a variety of methods.

*National Center on Universal Design for Learning*

# Universal Design for Learning: Tool for Teachers

**Includes sample strategies  
for classrooms**

## Options for Perception

- Use text equivalents in the form of captions or automated speech-to-text (voice recognition) for spoken language
- Provide visual diagrams, charts, notations of music or sound
- Provide written transcripts for videos or auditory clips
- Vary the display of information in a flexible format including:  
The size of text, images, graphs, tables, or other visual content.
- The contrast between background and text or image
- The color used for information or emphasis
- The volume or rate of speech or sound
- The speed or timing of video, animation, sound, simulations, etc
- The font used for print materials

## Sample Resources

[Customize Display](#)  
[Additional Resources and Information](#)

# Universally designed assessments:

- *are designed from the beginning to be accessible and valid for the widest range of students*
- **provide optimal standard assessment conditions**

# Universally Designed Assessments (UDA)

Tests that remain true to constructs, are easy to understand, and contain language that is accessible to all will give the truest readings of what students do and do not know.

Universal Design does not mean “dumbing down” a test.

# Who Benefits?

- **Universal design does not apply exclusively to people with disabilities or limited English proficiency**
- **It applies to all individuals, with wide ranging characteristics**

# Multi- State GSEG Consortium

Alabama

Hawaii

Tennessee

South Dakota

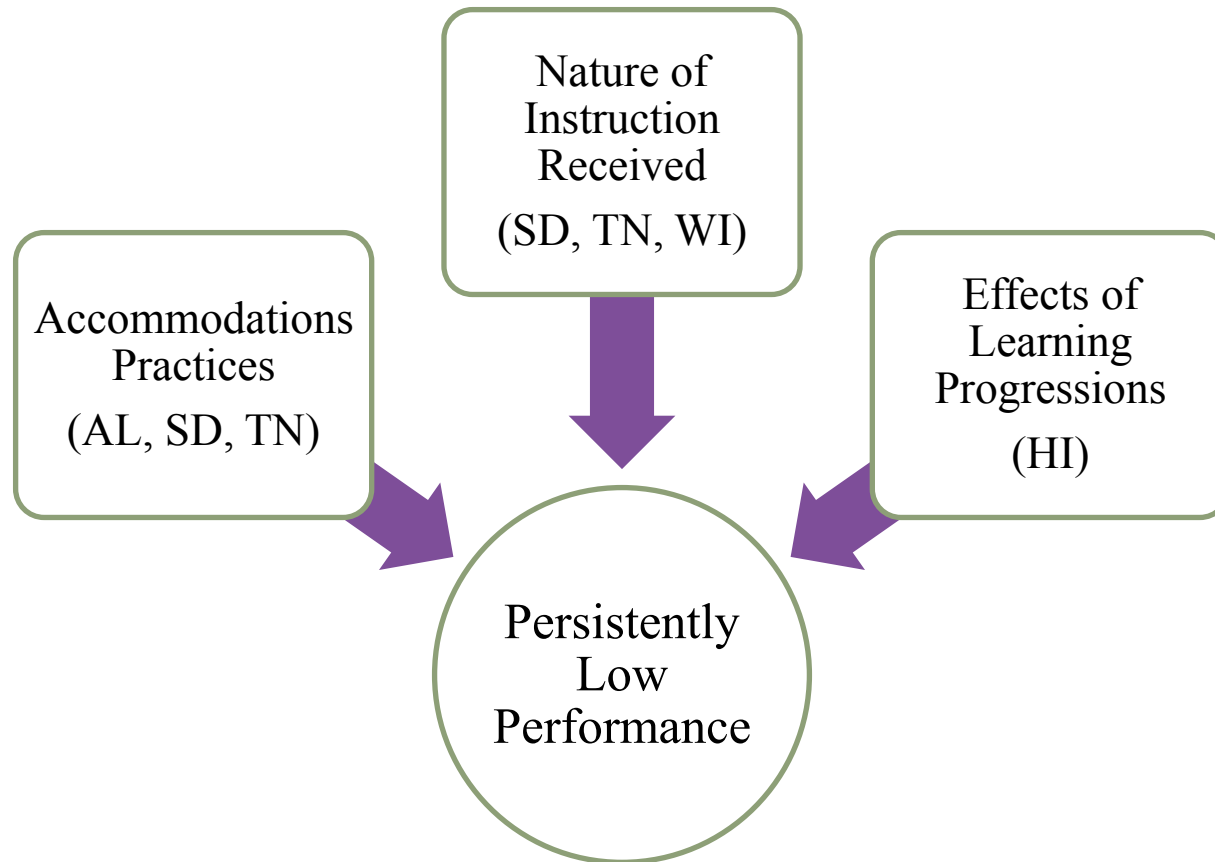

Wisconsin

**National Center on Educational Outcomes (NCEO)**

# Multi- State GSEG Consortium

# Alabama GSEG

- What strategies can improve the universal design of assessments for low performing students with disabilities?
- What is universal design? . . . vs. . . . What is a lowered achievement expectation?

# Elements of UD Assessments

- **Inclusive assessment population**
- **Precisely defined constructs**
- **Accessible, non-biased items**
- **Amenable to accommodations**

# Elements of UD Assessments (continued)

- **Simple, clear, and intuitive instructions and procedures**
- **Maximum readability and comprehensibility**
- **Maximum legibility**

*Thompson, Johnstone & Thurlow (2002)*

# UD Assessment Items

- Measures what it intends to measure
- Respect diversity of assessment population
- Have clear format for text
- Have clear pictures and graphics (when essential to item)
- Have concise and readable text
- Allow changes to its format without changing its meaning or difficulty

*Thompson, Johnstone, Anderson, & Miller (2005)*

# Additional UDA Considerations for Computer-based Tests

- Layout and design
- Navigation
- Computer capabilities

# Recommendations

- Incorporate elements of UD in early stages of development
- Include disability and language acquisition experts in items reviews
- Provide professional development for item developers and reviewers on UD
- Present the items being reviewed in format they will appear on test
- Include standards being tested with the items being reviewed
- Try out items with students
- Field test items in accommodated formats

*Thompson, Johnstone, Anderson, & Miller (2005)*

# The Opportunity

- UD can help ensure that assessments do not restrict learning opportunities.
- UD can help us rethink how to create assessment items that provide a more accurate picture of what students know and can do.

  - South Carolina Dept. of Education

# Barriers to Access

\* Adapted from Kurz & Elliott (2011)

# Anatomy of an Item

# Guiding Theories & Research for Item Modifications

- ▣ Evidenced-based model of test score validity,
- ▣ Universal design principles,
- ▣ Cognitive Load Theory for designing instructional materials, and
- ▣ Item writing research and practices.

# Characteristics of Appropriate Modifications

## Design Elements

- Simplify words and text structure
- Delete extraneous words
- Improve visuals and locate within item
- Use bold text for important words
- Examine answer distractors for plausibility and disproportionality of selection

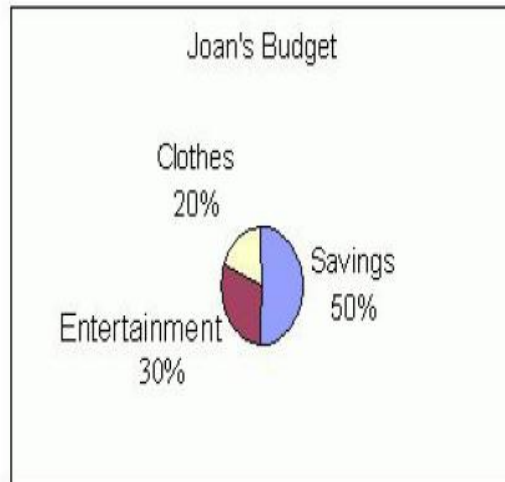

## Desired Outcomes

- Increase accessibility
- Decrease item difficulty
- Increase item discrimination
- Increase reliability estimates
- Reduce readability level w/in grade range
- Maintain alignment w/ content stds.
- Maintain DOK for all items
- Reduce need for accommodations
- Reduce number of words; Improve students' perceptions of tests & motivation to engage in testing

**The result: Increased test score validity!**

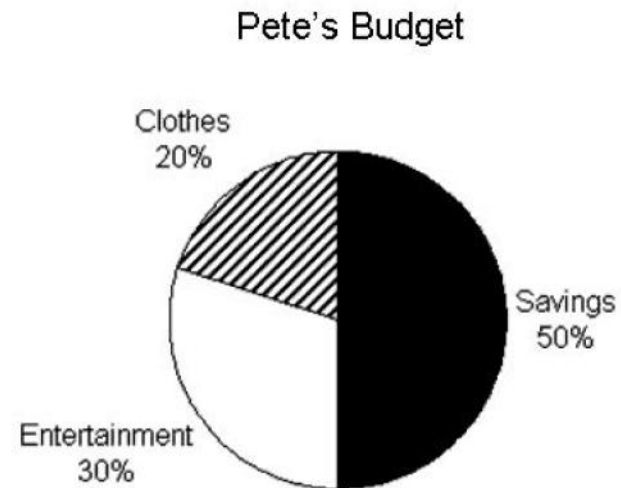

# Example: Original to Modified Item

4. Joan earns \$100 per month working part-time in a music store. Look at the pie chart that shows how Joan budgets her money each month. If Joan sticks to her budget, how much can she spend on clothes and entertainment each month?

- ☐ A. \$50.00
- ☐ B. \$40.00
- ☐ C. \$30.00
- ☐ D. \$20.00

4. Pete earns \$100 per month. Based on the graph, how much can he spend on clothes and entertainment each month?

- ☐ A. \$50.00
- ☐ B. \$30.00
- ☐ C. \$20.00

# TAMI-ARM

## Test Accessibility and Modification Inventory-Accessibility Rating Matrix™

**Test accessibility** is defined as the extent to which a test and its constituent item set permits the test taker to demonstrate knowledge of the target construct. Accessibility involves an interaction between the test and individual test-taker characteristics.

The image displays two sample forms from the TAMI-ARM system. The left form, titled 'Accessibility Rating Matrix', is a purple document with the TAMI logo and title. It includes sections for Purpose, Definition, and Instructions. The right form, titled 'ARM Record Form', is a yellow document with the TAMI logo and title. It includes fields for Test Name, Content Area / Grade Level, Item Numbers, Rater ID, and Comments. Both forms are part of the TAMI-ARM system, which is designed to facilitate a comprehensive analysis of individual test items with regard to their accessibility for all test-takers.

**Accessibility Rating Matrix**

**TAMI**  
Test Accessibility and Modification Inventory™

*Purpose*  
The purpose of the TAMI™ Accessibility Rating Matrix (ARM) is to facilitate a comprehensive analysis of individual test items with regard to their accessibility for all test-takers.

*Definition*  
**Test accessibility** is defined as the extent to which a test and its constituent item set permits the test-taker to demonstrate knowledge of the target construct. Accessibility involves an interaction between the test and individual test-taker characteristics.

*Instructions*

1. Write the item's ID number on the ARM Record Form.
2. Analyze the item using the Item Analysis rubric of the ARM to determine accessibility levels (1-4) for each of the five essential elements of the item (i.e., Passage/Stimulus, Item Stem, Visuals, Answer Choices, Page/Item Layout). Record these accessibility levels on the ARM Record Form. If the item contains both a passage and a separate stimulus, rate each individually.
3. Select modifications from the Modification Guide on the ARM Record Form that are likely to improve the accessibility of the item.
4. Record an Overall Accessibility Rating (1-4) for the item after reviewing your analytical ratings and using the Overall Analysis rubric of the ARM.

# TAMI's Accessibility Levels

**4**  
**Maximally Accessible for Nearly All Test-Takers**

- Item contains only content (words, visuals) that is essential for responding to the item.
- All item text is minimal in length and written as plainly as possible.
- Item stem is positively worded, written in the active voice, and the target construct is evident.
- Any included visuals are necessary and clearly depict the intended image(s).
- All answer choices are necessary, plausible, and balanced with regard to length, content, and order.
- Entire item and all information essential for responding is presented together on one page/screen in a manner that facilitates responding.

**3**  
**Maximally Accessible for Most Test-Takers**

- Item contains some content that is not essential for responding to the item.
- Stem is positively worded, written in the active voice, and the target construct is evident.
- Included visuals are not as simple or clear as possible.
- Visuals are not integrated with the other item elements.
- One or more distractors is unnecessary and/or answer choices are unnecessarily complex or unbalanced with regard to length, content, and order. Only **one** option is correct.
- Item layout is somewhat cluttered, or test-taker must turn the page to respond to the item.

**2**  
**Maximally Accessible for Some Test-Takers**

- Item contains content that is not essential for responding to the item, to the extent that it may be distracting or confusing to the test-taker.
- The wording of the item stem may cause some confusion as to what is required.
- Included visuals are unnecessary **and** potential distract the test-takers from essential item elements, **or** visuals are do not clearly depict the intended images or are unnecessarily complex.
- One or more distractors is implausible or absurd.
- Answer choices are unnecessarily complex or unbalanced with regard to length, content, and order.
- Rationale could be made for more than one correct response.
- Nonessential item elements in the page layout may draw test-taker attention away from essential content, or the test-taker must turn the page 2 or more times to respond to the item.

**1**  
**Inaccessible for Many Test-Takers**

- The item contains a large amount of content that is not essential for responding to the item, to the extent that it is likely to confuse the test-taker.
- Stem is negatively worded, in passive voice, and/or it is not evident what is required.
- Included visuals are irrelevant and may cue test-taker to an incorrect response, **or** included visuals are likely to confuse the test-taker due to complexity or lack of clarity.
- Answer choices are unbalanced in a manner that may cue an incorrect response, contain more than one correct answer, and/or are implausible/absurd.
- Nonessential item elements in the page layout are likely to draw attention from essential information, or a large amount of essential information is presented across multiple pages/screens.

# Item Example – Original

32. Mr. Miyagi has instructed Daniel-San to spend the day washing all of his classic automobiles. If Daniel-San finishes the task, Mr. Miyagi will give him one of the cars for his birthday. Mr. Miyagi has 25 automobiles in all. If Daniel-San can wash 3 automobiles in 37 minutes, how many automobiles can he wash between noon and 4 o'clock in the afternoon?

- A. 19 cars
- B. 45 cars
- C. 3 cars
- D. 20 cars

33. Alexander and Eleanor have decided to spend the afternoon playing a game. They decide to play Foursquare. Alexander found a playground ball that was approximately 8 inches in diameter. Eleanor brought some playground chalk. Jimmy drew the court. The width and length of one square of the court are each 3 feet. What is the total area of the court in square feet?

- A. 9 square feet
- B. 12 square feet
- C. 24 square feet
- D. 36 square feet

34. Keanu is driving a bus. If the bus makes 5 stops, and it picks up an average of 7 people on each stop, about how many people will be on the bus when it reaches its destination?

- A. 14 people
- B. 49 people
- C. 21 people
- D. 35 people

35. Laverne organized a party to celebrate Shirley's 78<sup>th</sup> birthday. All of their friends are invited. Arthur brought Quiche Lorraine for dinner. If the radius of the quiche is 6 inches, what is the circumference?

- A. Approximately 38 inches
- B. 12 inches
- C. Approximately 113 inches
- D. 60 inches

36. There are 145 invited guests to a luncheon organized by the Kiwanis club. If all of the attendees are over the age of 50, what is the mean age of the people attending the luncheon?

- A. 50
- B. Over 50
- C. Under 50
- D. Approximately 60

37. Jorge wants to make a fruit salad for Thanksgiving. He went to the supermarket and bought 4 grapefruit, 6 kiwi, 12 apples, 4 pears, 11 bananas, and 3 oranges. Bananas and kiwi make up what percentage of the total number of fruit Jorge bought?

- A. 12.5 percent
- B. 25 percent
- C. 42.5 percent
- D. Over 50 percent

38. September, April, June, and November all consist of 30 days. February consists of either 28 or 29 days, depending on whether it is a leap year. How many months have more than 30 days?

Domain: Math  
Words: 75  
Readability: 5.5

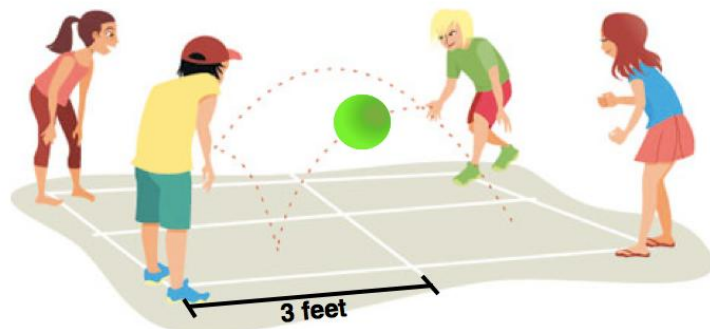

TAMI ARM rating:  
Inaccessible for many  
test-takers (Rating: 1)

Target construct:

Use knowledge of 2-dimensional shapes to solve real-world calculation problems (Gr. 5)

# Item Example – Modified

**33** Foursquare is a game that is played with a ball on a court that is made up of **4 congruent squares**. Look at the picture below.

The kids are playing Foursquare. If one square is 3 feet long and 3 feet wide, what is the **total area** of the Foursquare court?

- ☐ 9 square feet
- ☐ 24 square feet
- ☐ 36 square feet

Domain: Math  
Words: 60 (-20%)  
Readability: 3.2 (-2.3)

TAMI ARM rating:  
Maximally Accessible  
for nearly all test-takers  
(Rating: 4)

Target construct:

Use knowledge of 2-dimensional shapes to solve real-world calculation problems (Grade 5)

# Modifications Benefited all Groups

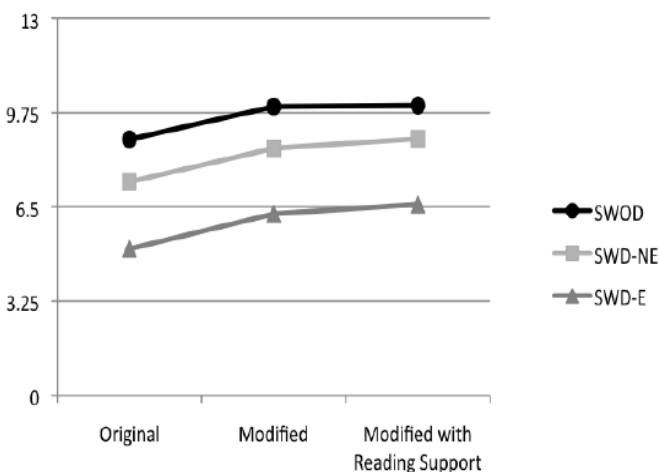

*Cohen's d for Reading and Mathematics by Group and Modification<sup>1</sup>*

| SWOD        | .15      | .20                              | .05                              |
| SWD-NE      | .21      | .25                              | .05                              |
| SWD-E       | .26      | .31                              | .04                              |
| Total       | .21      | .25                              | .05                              |

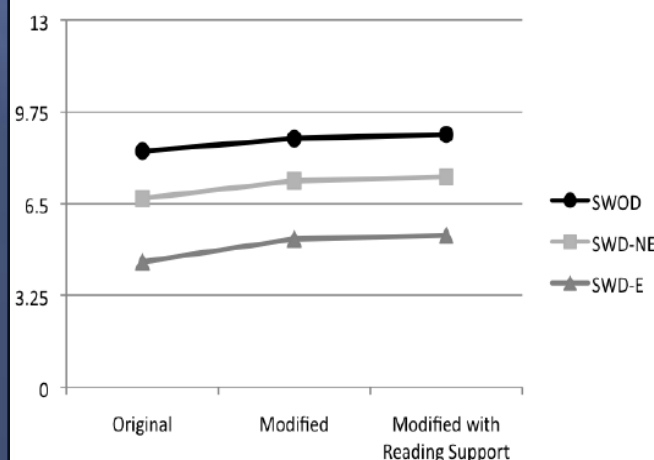

<sup>1</sup> To determine the effect sizes for the Modified and Modified with Reading Support condition, the Original condition served as the point of comparison.

Elliott, et al. (2010), *Exceptional Children*

*Figure 3. Mean test scores by group and condition in reading.*

*Figure 4. Mean test scores by group and condition in mathematics.*

# Evidence Indices for Desired Changes

## If Desired Outcomes

- ▣ Increase accessibility
- ▣ Decrease item difficulty
- ▣ Increase item discrimination
- ▣ Increase reliability estimates
- ▣ Reduce readability level
- ▣ Maintain alignment w/content stds.
- ▣ Maintain DOK for all items
- ▣ Reduce need for accommodations
- ▣ Improve students' perceptions of tests & motivation to engage in testing

## Indices of Change

- ▣ TAMI Overall ARM rating
- ▣ p value or percent correct
- ▣ D or point-biserial correlation
- ▣ KR-20 or coefficient alpha
- ▣ Flesch-Kincaid grade level
- ▣ Judged to be aligned when using approved alignment method
- ▣ DOK level indicator
- ▣ Number of accommodations
- ▣ Cognitive ease ratings , self-reports, time

It would facilitate communication & advance our science if we all reported at least a common set of item/test indices!

# Lessons Learned from AA-MAS Item Modification Research

1. One characteristic shared by many in the AA-MAS eligible group is slow reading. Thus, reducing number of words to be read facilitates persistence, engagement, and comprehension.
2. Modified items that are less complex, but still aligned with grade level content standards and measuring the same DOK, can result in improved performance for all students.
3. Easy and effective modifications include highlighting the question asked, simplifying language, and reducing the number of answer choices. These elements often shorten a given item, thus also allowing for more items within the same general time frame.
4. Modified items can result in equal or better measurement precision for the eligible population.

# Conclusion from Item Modification Studies:

## *Less is More...*

...or at least, *Less is equal* (in terms of measurement precision) and *simpler* (in terms of reading and cognitive load) and allows eligible students a better opportunity to experience success, so *less is also better* for all students.

# Tests are Designed to Measure What Students Know and the Effects of their Instruction, but .....

What if instruction on the content covered by the test item has not been provided?

What if some students received instruction and others have not received instruction on the content tested?

- ❑ A number of students and also their teachers told us that they had NOT been taught content measured on their state test.
- ❑ Test developers have usually tried to address these concerns by conducting alignment studies, using tools/methods like the SEC or Webb's Alignment method. Note these methods are insensitive to individual students.

Alignment is a poor proxy measure for Opportunity to Learn!

# Initial Method for Documenting OTL

| Curricular Experiences Survey/4 <sup>th</sup> grade<br>Cognitive Lab Study<br>CMAADI-AZ Project   |             |               |                   |   |   |   |
|---|-------------|---------------|-------------------|---|---|---|
| <b>Student's Name:</b>  |             |               |                   |   |   |   |
| Directions: For the student listed above, indicate the extent of content coverage (# of lessons provided during this current school year) for each of the following objectives.   |             |               |                   |   |   |   |
| <p>NC – No coverage (Not an objective addressed during this school year)</p> <p>P – Plan to cover this objective later in this school year</p> <p>1 = Minimal coverage (1-5 lessons to this point in the school year)</p> <p>2 = Moderate coverage (6 -10 lessons to this point in the school year)</p> <p>3 = Extensive coverage (11 or more lessons to this point in the school year)</p> <p>4 = Intensive, systematic coverage (daily/nearly daily instruction throughout the school year)</p> |             |               |                   |   |   |   |
| Reading/Language Arts   |             |               |                   |   |   |   |
| Objective   | No Coverage | Plan to Cover | Coverage Provided |   |   |   |
| 1. Using context to determine the relevant meaning of a word.   | NC          | P             | 1                 | 2 | 3 | 4 |
| 2. Identifying the main idea and supporting details.  | NC          | P             | 1                 | 2 | 3 | 4 |
| 3. Describing the historical and cultural aspects found in cross-culture works.   | NC          | P             | 1                 | 2 | 3 | 4 |
| 4. Determining the author's main purpose.   | NC          | P             | 1                 | 2 | 3 | 4 |
| 5. Determining the author's position regarding a particular idea, subject, concept, or object.  | NC          | P             | 1                 | 2 | 3 | 4 |

CMAADI AZ Cog Lab  
Study, 2008

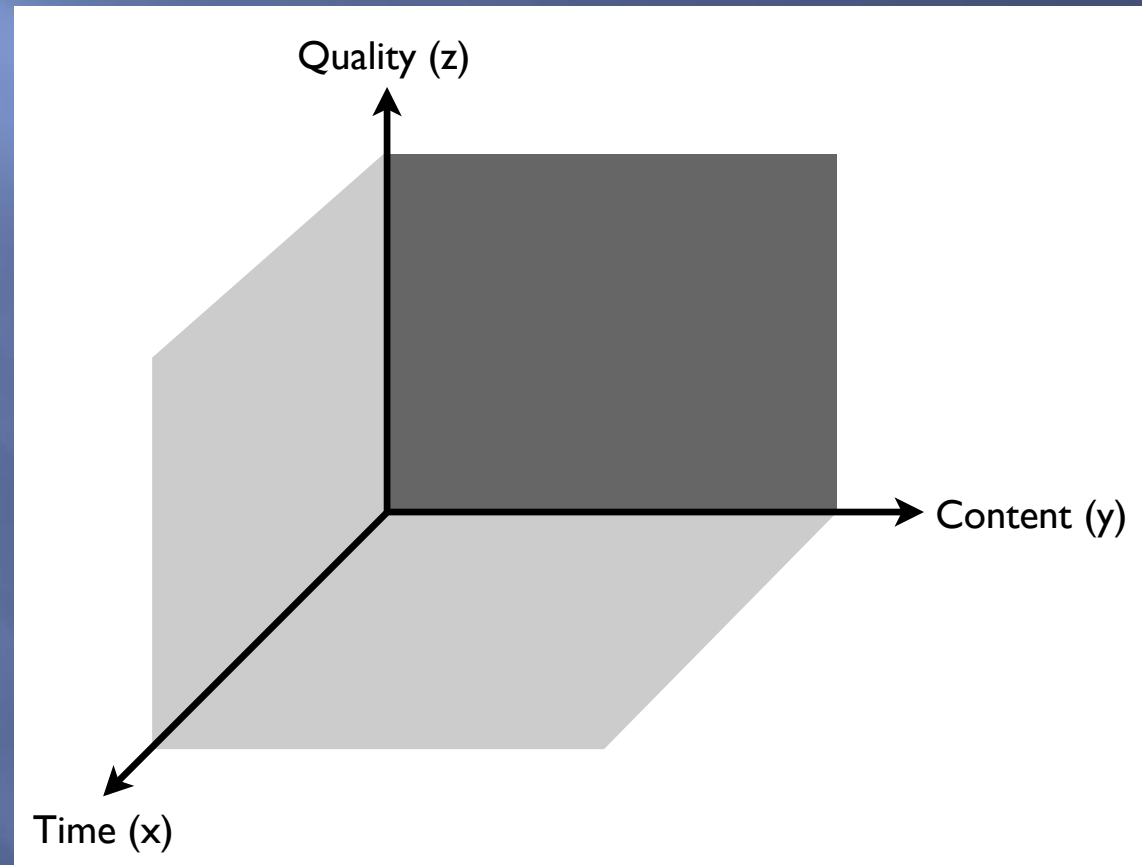

# Opportunity to Learn (OTL)

Opportunity to learn is defined as: *the degree to which a teacher dedicates instructional time and content coverage to the intended curriculum objectives emphasizing high-order cognitive processes, evidence-based practices, and alternative grouping formats.*

This definition is the conceptual foundation for the indices measured by the Instructional Learning Opportunity Guidance System (MyiLOGS; Kurz, Elliott, & Shrago, 2009), an online measure developed in a recently completed USDE Enhanced Assessment Grant (Award # S368A090006).

# Time, Content, & Quality all Matter!

## Unified Model of OTL

# MyiLOGS: A Measure of OTL

- **My instructional Learning Opportunities Guidance System** (MyiLOGS; Kurz, Elliott, & Shrago, 2009) allows teachers to document their planned and enacted instruction along their state-specific intended curriculum. Created as part of an USDE Enhanced Assessment Grant to Pennsylvania Dept. of Education.
- OTL is documented along **three key dimensions** (i.e., time, content, and quality) at the **classroom and individual student level**. MyiLOGS captures:
  - Coverage of state-specific subskills
  - Time spent on each subskill
  - Cognitive expectations for student learning
  - Use of evidence-based instructional practices
  - Use of instructional grouping formats
  - Student engagement

# MyiLOGS: Instructional Reports

**Broad Content Domain Coverage Pie Chart (Calendar Days)**

**Teacher:** turquoise1005m **Class:** Tunnell Gr. 8 Math

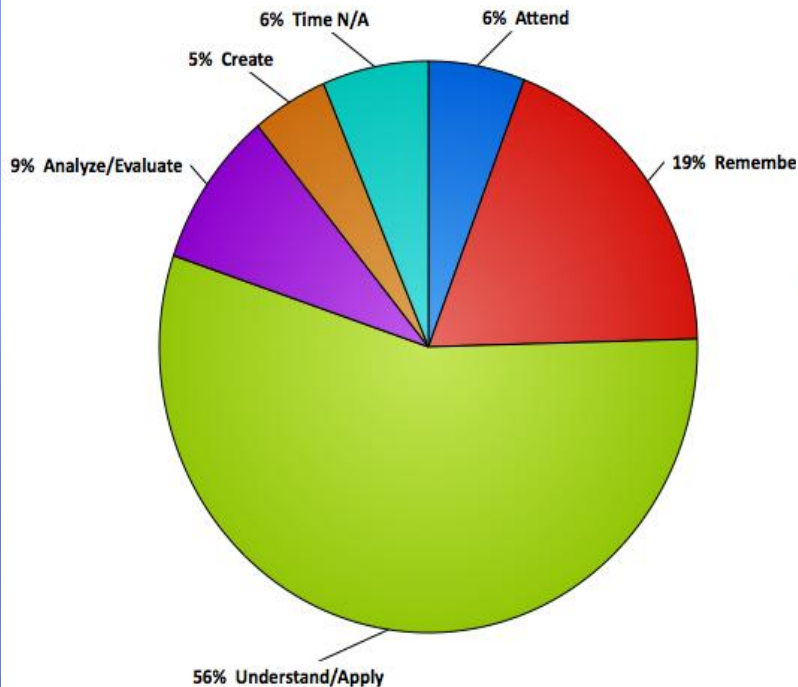

**Date Range:** 08/01/2010 - 07/31/2011

**Time Allocation by Domain**

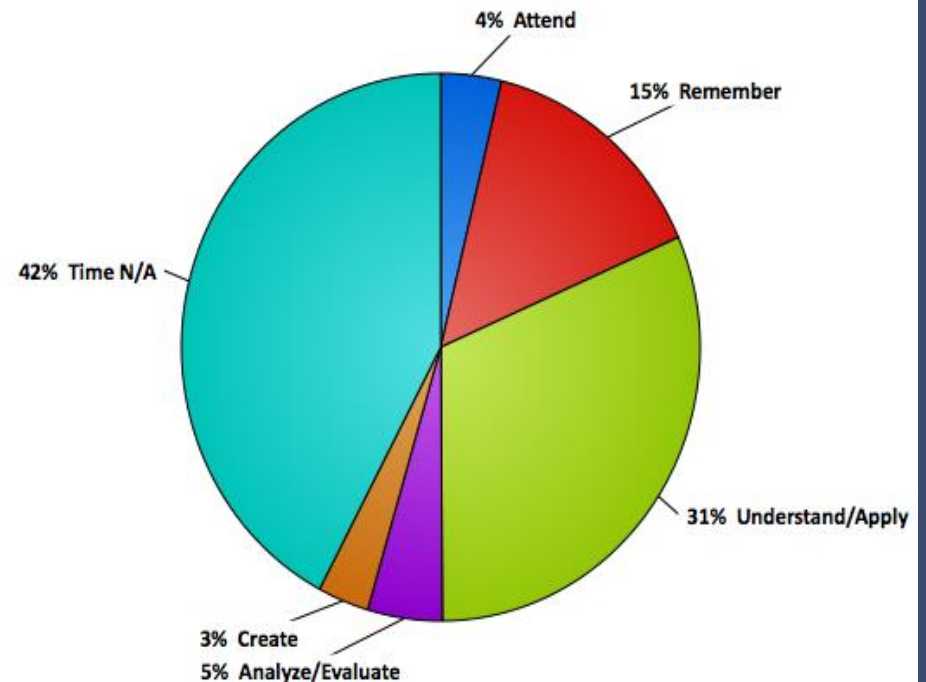

# Comparison of Class and Student: Cognitive Processes

**Cognitive Processes: 52 Day Sample**

**anteater\_1201: 26 Day Sample**

# Key Findings Regarding OTL

- ❑ Initial OTL data from 3 states indicated that general and special education teachers spent about 66% of their allocated class time on teaching the academic standards of the general curriculum, another 25% on custom skills/activities, and about 5% on non-instructional activities/tasks. Teachers covered approximately 68% of the academic standards based on an average of about 151 school days before their state test.
- ❑ Teachers placed greater emphasis on higher-order thinking skills in general education classrooms than in special education classrooms.
- ❑ Differences between general and special education teachers related to Time on Standards and Content Coverage indicated effect sizes above .50. Given that students in both types of classes were held to the same general curriculum standards irrespective of educational setting, it is problematic that teachers in special education classes provided less instructional time and coverage of the academic standards.

# Major Conclusion from OTL Studies

“Based on this sample’s general education classrooms, which represented a full inclusion model, **students with disabilities experienced less time on standards, more non-instructional time, and less content coverage compared to their class. ... At least for students with disabilities nested in general education classrooms, OTL appears to be a differentiated opportunity structure. ...the instructional differences do not indicate equal or equitable OTL for students with disabilities.** Given their disability-related characteristics, students with disabilities may need at least as much OTL, if not more, than their peers without disabilities. However, the current findings suggest the exact opposite; if replicable, these data would pose serious instructional challenges for teachers and hold profound implications for policy makers focusing on academic proficiency and growth without consideration for the instructional inputs and processes that affect student outcomes.”

(Kurz, Elliott, Lemons, Zigmond, Kloo, & Kettler, 2012)

# Implications of OTL Research for Test Developers

- ▣ Studies must be conducted to establish the reasonableness of validity claims about relationships between instruction and test scores.
- ▣ Teachers need substantial support to meaningfully cover the intended general curriculum with all students, in particular those with disabilities. Many students with disabilities will need 30 to 40 more days of class time annually to have equitable OTL.
- ▣ Alignment is important, but current alignment measures are insensitive to individual students instruction. Thus, alignment is a poor indicator of OTL for students with disabilities.

*1. How can tests be modified to improve the measurement of knowledge and skills of students with persistent academic difficulties and who would qualify to take an AA-MAS, if available?*

*2. How can testing conditions be improved to increase the likelihood that all students have had the opportunity to learn the content standards that the tests are designed to measure?*

Our research has provided some practical tools that can help answer these questions and offer students with disabilities more opportunities to demonstrated what they have learned.

Make research matter! Use this knowledge to advance assessment and instructional practices for all students.

# Grade 8 Mathematics SOL Item

userFName M userLName  
Test Title X Exit

The line graph shows the heights of water in a container that Manny recorded over a 5-hour period for a science project.

**Manny's Science Project**

A line graph titled 'Manny's Science Project' showing the height of water in centimeters over a 5-hour period. The y-axis is labeled 'Height (centimeters)' and ranges from 0 to 10 in increments of 1. The x-axis is labeled 'Time (p.m.)' and ranges from 1:00 to 6:00 in increments of 1 hour. The graph shows a line connecting the following points: (1:00, 7), (2:00, 6.25), (3:00, 5), (4:00, 4.25), and (5:00, 3). The line shows a decreasing trend.

| Time (p.m.) | Height (centimeters) |
|-------------|----------------------|
| 1:00        | 7                    |
| 2:00        | 6.25                 |
| 3:00        | 5                    |
| 4:00        | 4.25                 |
| 5:00        | 3                    |

If the height of the water continues to decrease as shown, which is closest to its height at 6:00 p.m.?

- A 3.00 cm
- B 2.75 cm
- C 1.50 cm
- D 0.25 cm

The line graph shows the height of water in a container that Manny recorded over a 5-hour period.

**Height of Water**

| Time (P.M.) | Height (centimeters) |
|-------------|----------------------|
| 1:00        | 7                    |
| 2:00        | 6.25                 |
| 3:00        | 5                    |
| 4:00        | 4.25                 |
| 5:00        | 3                    |

If the height of the water continues to decrease as shown, which is closest to its height at 6:00 P.M.?

☐ A 3.25 cm      ☐ B 2.75 cm      ☐ C 1.50 cm

Australia's Number 1 Rabbit-Proof Fence

1 It was 1901, and Australia was facing a huge problem. Rabbits! Hundreds of thousands of them! They were threatening to overrun pastures, orchards, crops, and plantations that provided food and income for farmers living on the western side of the continent.

**Rabbits Introduced to Australia**

2 Back in 1859, an Englishman, Thomas Austin, brought 24 rabbits to Australia's eastern state of Victoria. Never before had there been any rabbits on the Australian continent. Austin and other homesick English settlers thought rabbits would remind them of the green fields of home. They also felt the creatures would provide them with game to hunt.

3 There was one problem. The rabbit population swelled. Before long, the rabbits spread through Victoria, New South Wales, southern Queensland, and South Australia. Worse, the animals had begun marching west.

Australia's Number 1 Rabbit-Proof Fence

# Reading Supports and Simplifications

- Shortened reading passages without changing reading level
- Excerpted relevant sections of reading and presented them with items
- Provided hint boxes to remind students to return to passage when item referred to passage as a whole

# Reading Supports and Simplifications (cont.)

- Used graphic organizers to present passage information
- Simplified language in stems
- Highlighted key words
- Reduced answer options from 4 to 3

# Lessons Learned

- Involve educators in identifying supports
- Be judicious in use of supports: “over-supporting” can be confusing to students
- Provide practice with items. VMAST practice items and guides for teachers may be found at:

[http://www.doe.virginia.gov/testing/alternative\\_assessments/vmast\\_va\\_mod\\_achievement\\_stds\\_test/practice\\_items/index.shtml](http://www.doe.virginia.gov/testing/alternative_assessments/vmast_va_mod_achievement_stds_test/practice_items/index.shtml)

## VIRGINIA MODIFIED ACHIEVEMENT STANDARDS TEST (VMAST)

### VMAST PRACTICE ITEMS

The VMAST practice items give students the opportunity to use research-based supports and simplifications that have been applied to existing online items to make them more accessible for students with disabilities. The practice items are samples only. They do not cover all content for the grade level, nor do they provide examples of all item types or functionality that may be found in the field test items.

For technical assistance, see [Technical Suggestions for Opening the Practice Items](#) (PDF)

# Best Practices for Assessing Low Performing Students in NextGen, Grade Level Assessments

Ideas from an Assessment Design and Psychometric Perspective

Steve Ferrara

May 22, 2012

# Overview

- Background and context
- Typical grade level test design
- How did programs go about designing and developing AA-MAS for low performing students?
- Ideas for NextGen grade level assessments
- What do we need to make these ideas work?

# Background and context

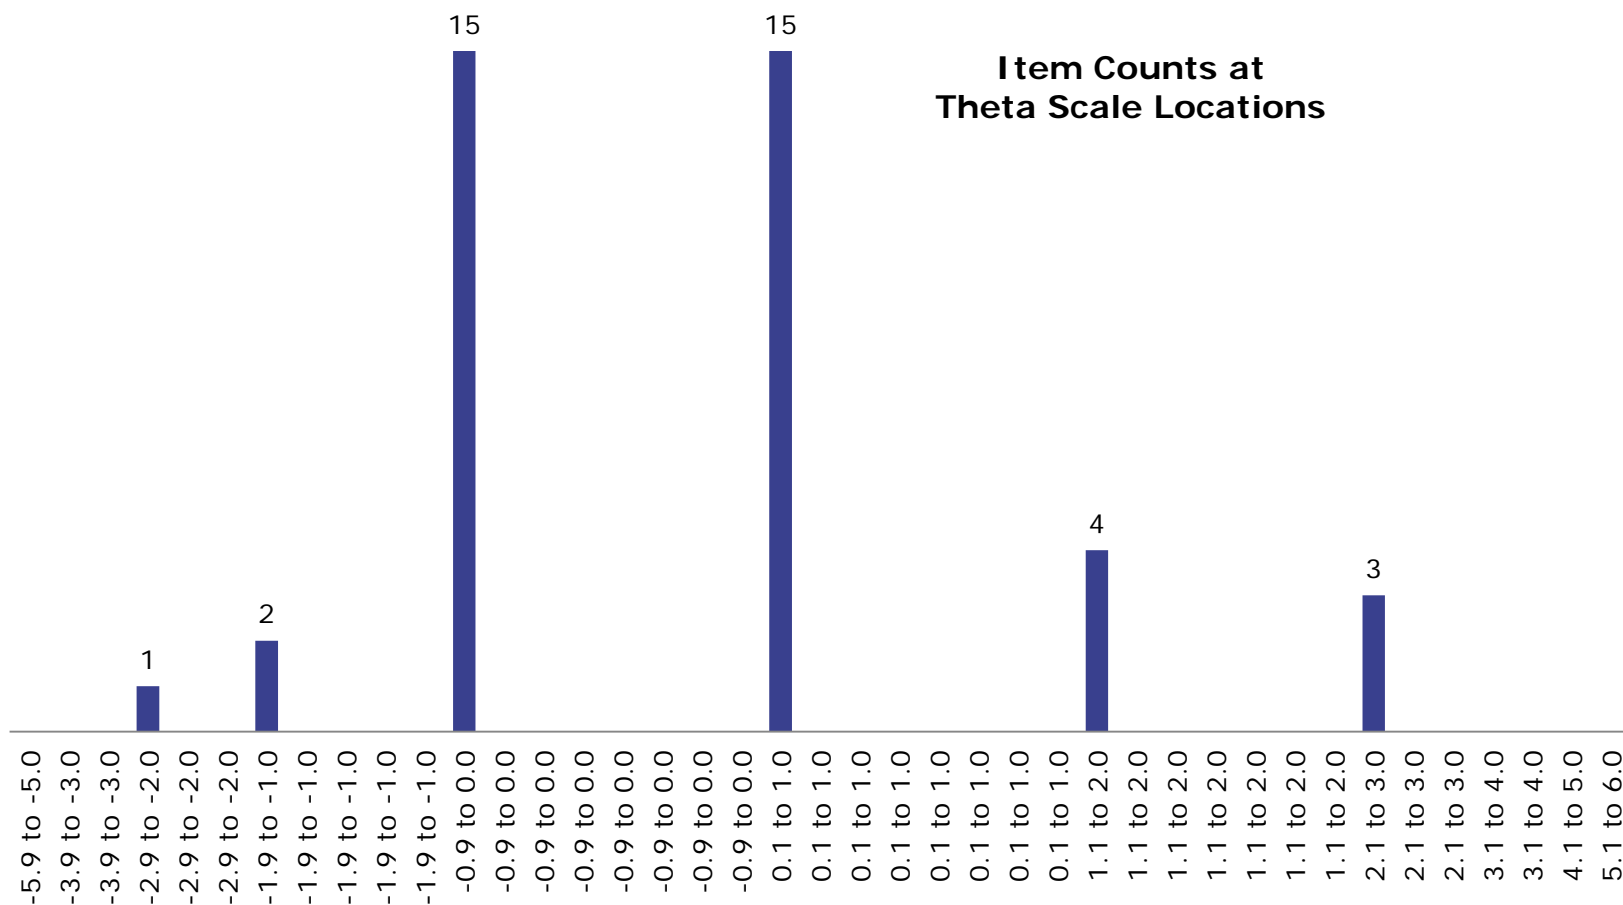

- High school special ed teacher in Massachusetts: mild and moderate disabilities
- Work on alternate assessments in several states
- GSEG grant award: AA-MAS design research, development, and tryouts

# Typical grade level test design

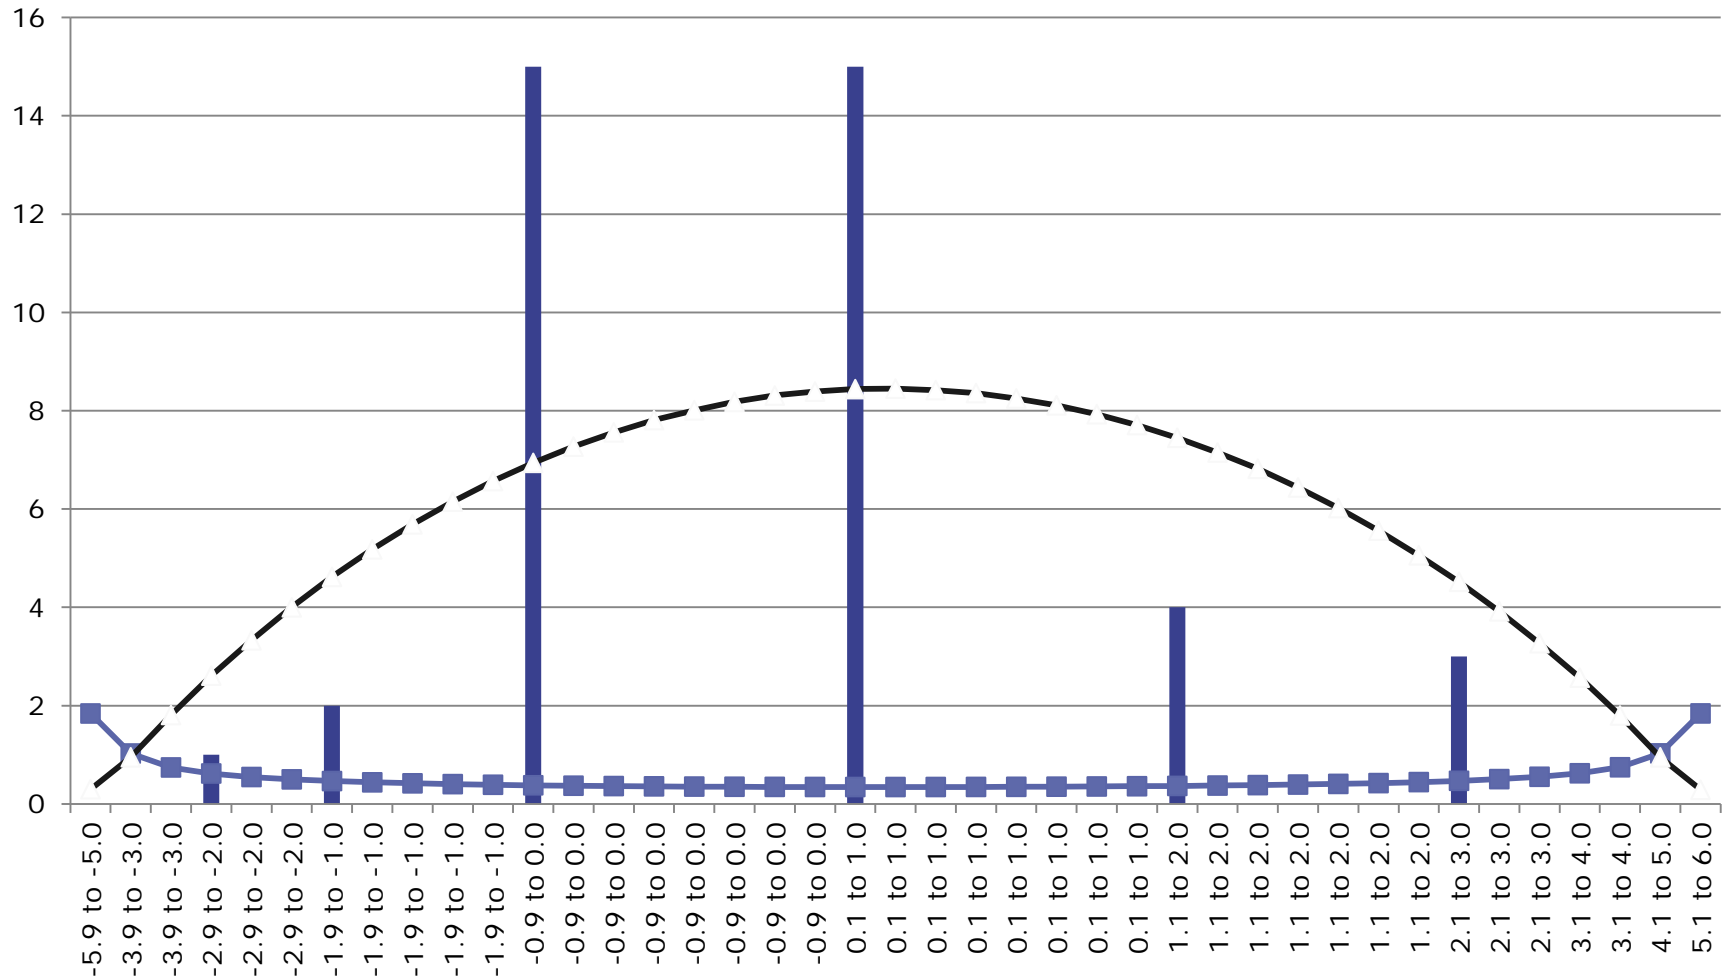

- How we typically design grade level assessments
- What we typically get from them

# Real test, typical grade level test design

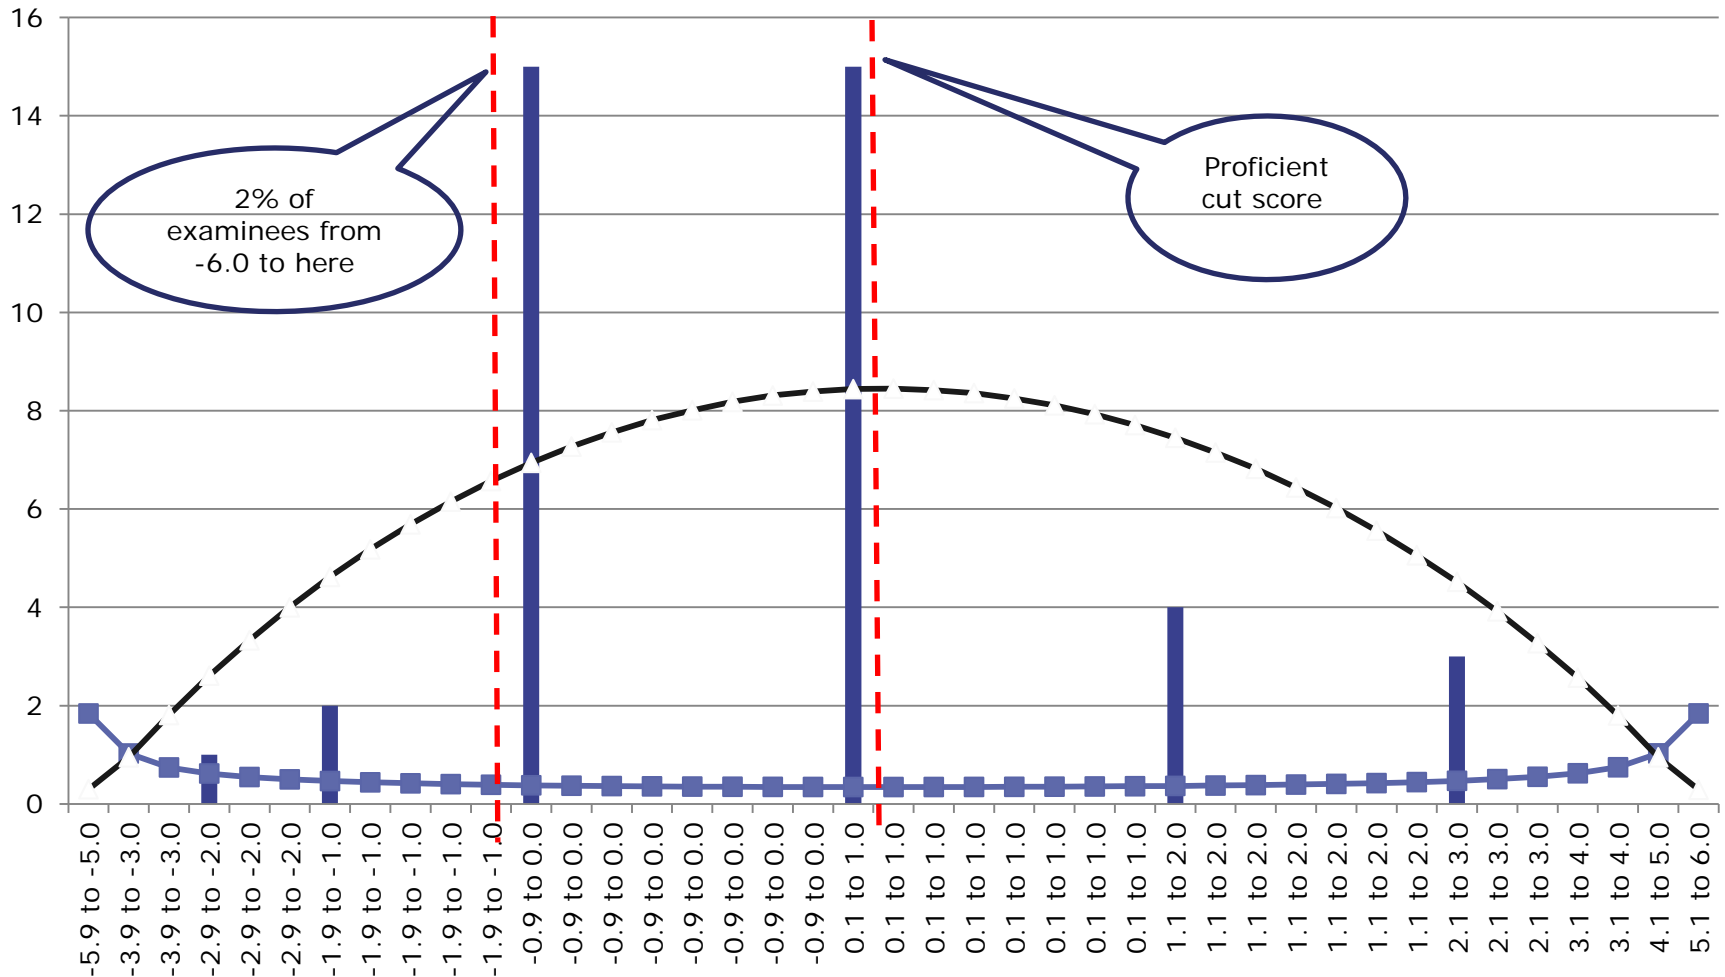

Item Counts at  
Theta Scale Locations

# Each item adds psychometric information, mostly about nearby examinees

# Item locations, score information, score standard errors

## So what do you see? What does this test give us?

- Lots precision for students in the middle of the scale, less precision for students at low and high ends of the proficiency scale
- $\alpha \sim .85$  and higher
- Result is good test targeting for most examinees, less so for low (and high) performing students
- Whether stated in assessment design and psychometric terms or not, a goal of AA-MAS was to target tests specifically for low performing students with disabilities
  - That is, to create more appropriately targeted tests of grade level content standards for these students

## How did programs go about designing and developing AA-MAS for low performing students with disabilities?

- Tried to make tests easier
  - While targeting on-grade content standards
- Successful programs
- Lots of research that yielded important empirical contributions to designing accountability assessments for low performing students with disabilities
  - E.g., methods to reduce cognitive load: *Test Accessibility and Modification Inventory* (TAMI); see <http://peabody.vanderbilt.edu/tami.xml>

# Ideas for targeting NextGen grade level assessments

- Solution ideas to start thinking and discussion; not **the** solution
- Adaptive testing approaches
  - Item level CAT
  - Multistage, multilevel testing—with a twist

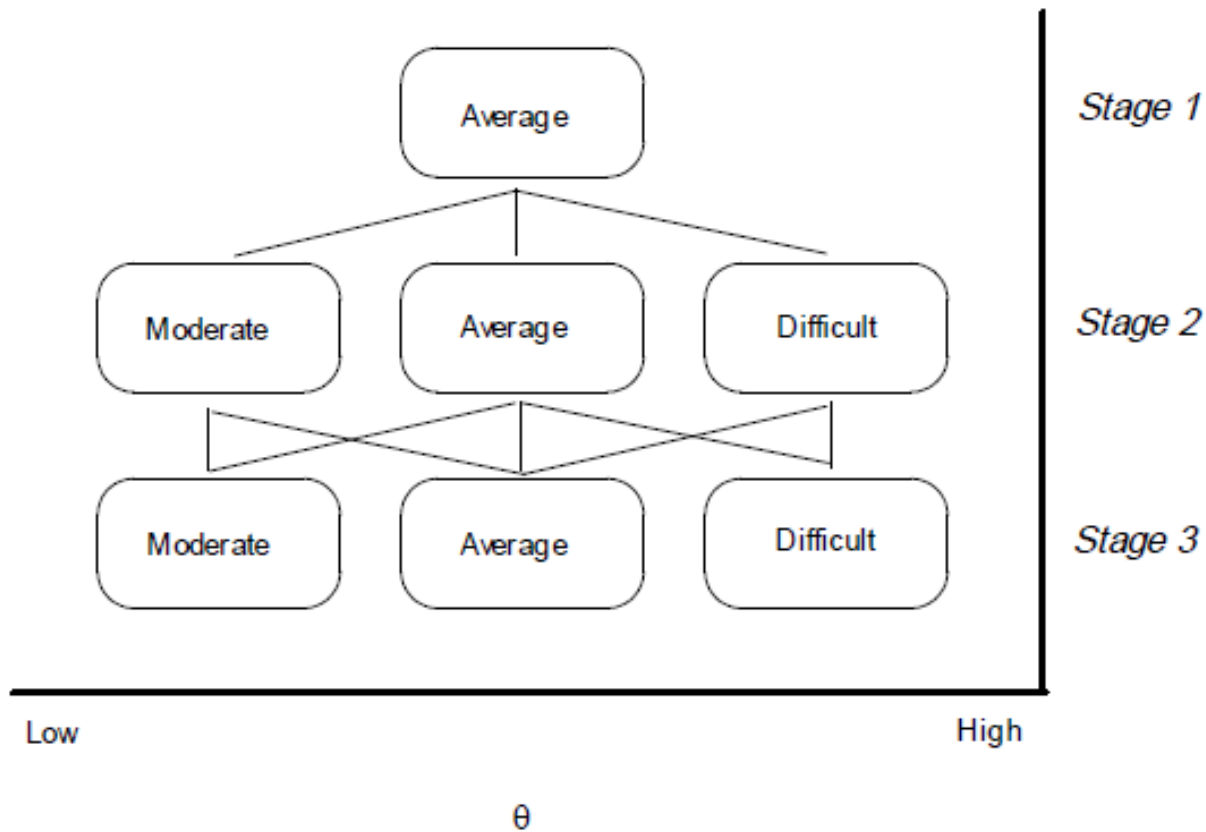

# Computer-adaptive testing (CAT)

- This is item level, adaptive test targeting
  - The process...
- Benefits
  - Effective test targeting → precise test scores for examinees at all locations on the test scale
  - Efficiency: often possible to reach a specified level of score reliability with shorter tests
  - Effectiveness: Low performing students faced with few items that are too difficult for them
- Interesting finding:
  - Higher performing students say...
  - Lower performing students say...

# Multistage, multilevel testing

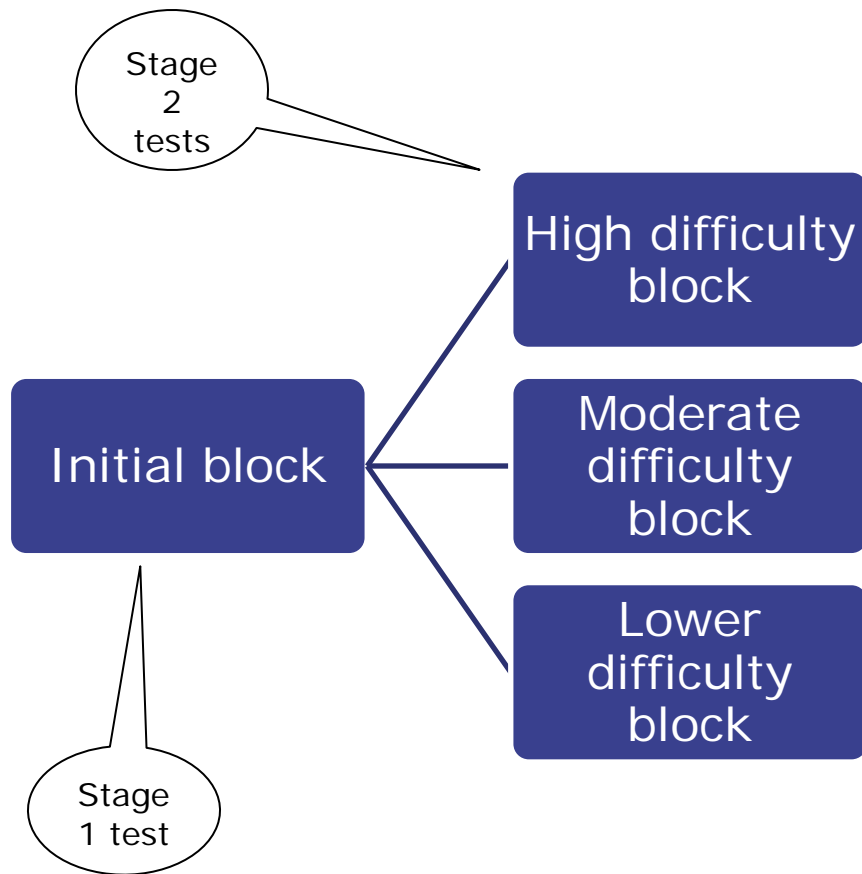

- Appears in many assessment design and measurement theory books (1970s and 1980s)
- Not in wide practice in educational testing, especially after item level CAT became operationally feasible in the mid-1980s
- Example
  - 15 item router test and three levels of 25 item tests, all on a single scale
  - High School Longitudinal Study of 2009 (HSLs:09); see <http://nces.ed.gov/surveys/hsls09/>

# Schematic illustration

From Ariel (2005)

# MSML design for NextGen grade level assessments

- All items and blocks on a single grade level scale
- All items and blocks selected from a single grade level pool
- Initial block representative of the full test blueprint
- Stage 1 score could be used for accountability reporting
- Stage 2 score:
  - Enhance the precision of the stage 1 score
  - Diagnostic targeting for low performing students with disabilities

## What do we need for CAT and MSML tests? Adequate numbers of appropriately targeted items

- Need on-grade level, well aligned items, located at the lower end of proficiency scale
  - Must cover all content standards
- Often a challenge to produce enough of these for all content standards
  - Also, what about DOK levels? Why not other frameworks for addressing complexity?

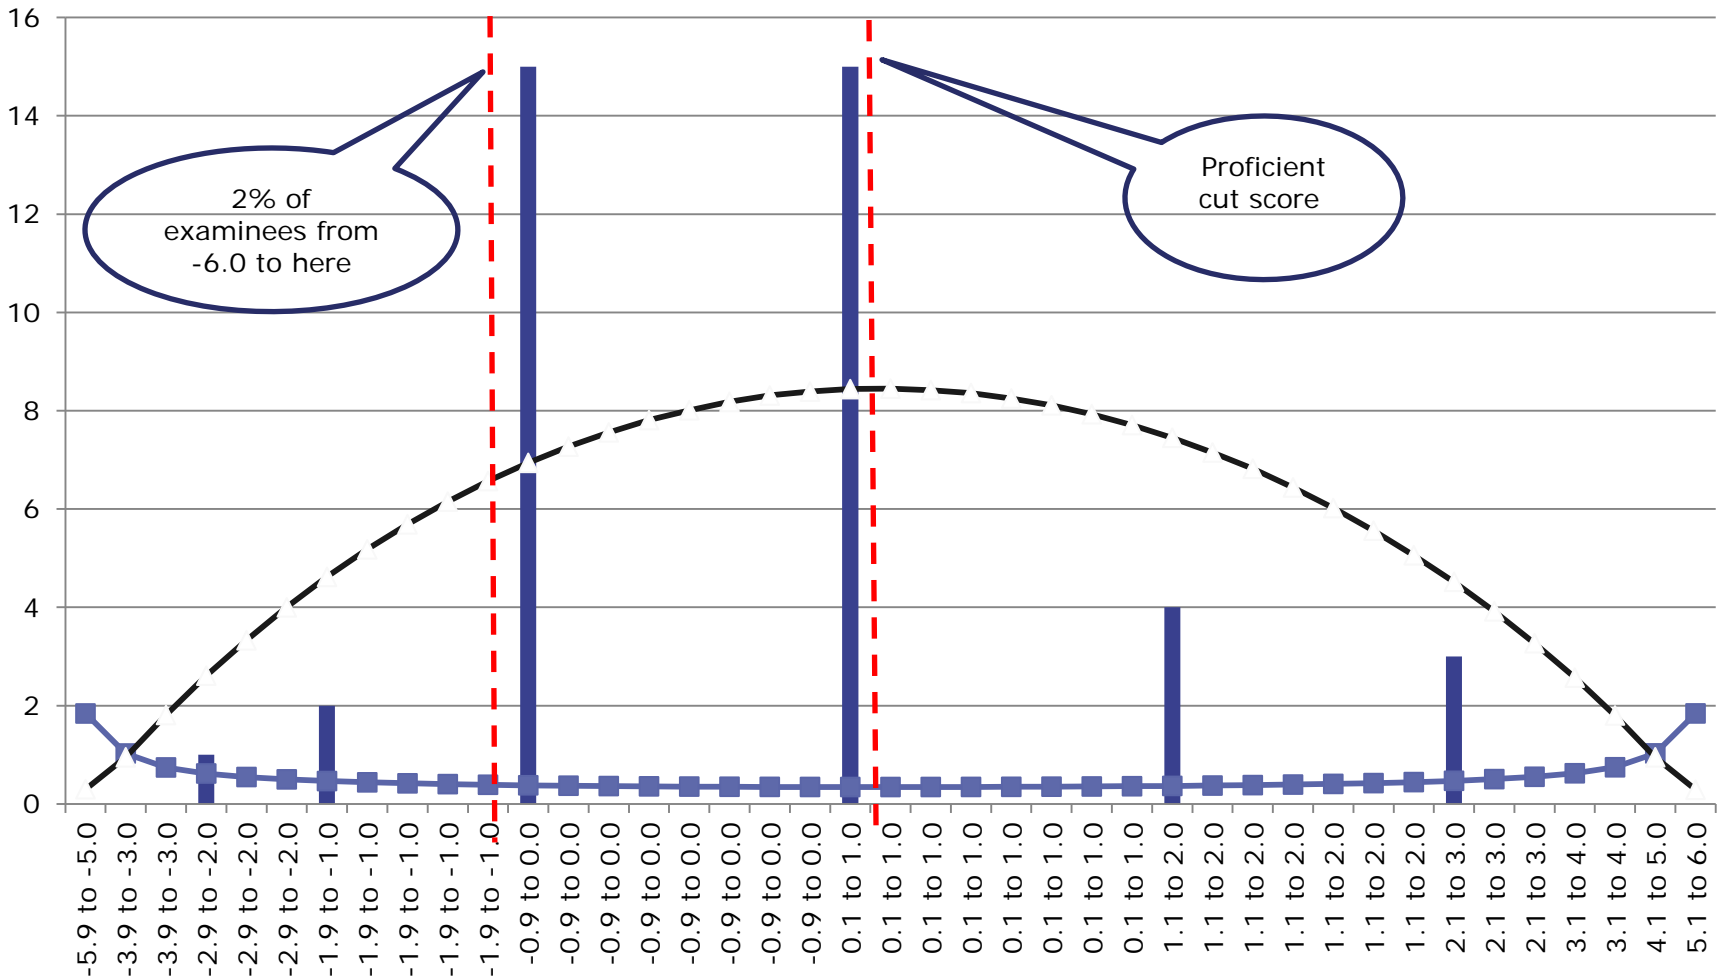

# Generating enough items for appropriate targeting: research and experimentation

- Use easiest items on grade level tests to guide new item development
  - Clone them
  - Identify “easiness features” to guide additional item development
- Develop on grade, prerequisite cousins of current items
- Reduce the complexity of moderately difficult items: reduce cognitive load and build in easiness features
- Strive for simplicity rather than easiness
  - Focus on DOK levels 1 and 2...
  - Language simplicity, cognitive load, etc.
- Select on-grade reading texts with lower *Levels of Meaning* and *Knowledge Demands*, simpler *Structure*, and higher *Language Conventionality and Clarity* (see appendix A of the CCSS for ELA/Literacy)

## Closing comments (a)

- While grade level test scores are reliable overall, score reliability for lower performing students is not as good as the overall test score reliability suggests
  - Just take a look at the size of the standard errors for the lowest scores in your grade level program's scoring tables ➔
- Multistage, multilevel testing can work with fixed forms, administered online and on paper
  - Item pool size and replenishment requirements are not as demanding as for item level CAT
  - Not a widely known approach—possible reluctance, resistance
- These ideas—MSML design and targeting item development—require further conceptualization, design, vetting, research, and experimentation

# Reminder

## Closing comments (b)

- Further conceptualization, design, and vetting
  - Would the policy community accept MSML testing? (cf. CAT)
  - Would state assessment programs accept it?
- Further research and experimentation
  - Ongoing, small scale item development projects focused on developing items that target grade level standards in the regions of score scales where many students with disabilities currently are performing
  - Build on the research from the last ~five years
  - Consider the empirical research on items with three response options: improved psychometric quality, minimal reduction of item difficulty—for all examinees
- Train item and task writers to hit difficulty targets more consistently (e.g., Ferrara et al., 2011)
  - We're not there yet

# Thanks!
